
Hedge funds: the case for 'trading strategies'

Pictet Alternative Investments
September 2010

A successful 'trading strategy' is able to adjust a portfolio's risk profile rapidly to short term market conditions, regardless of long term convictions. The use of trading strategies, especially Global Macro and Commodity Trading Advisors (CTAs) funds, has been effective in achieving resilience during periods of market stress.

Summary

While no-one doubts that future financial crises, by their very nature, remain unpredictable, one thing is certain: there will be crises in the future. Investors must therefore find ways of minimising the impact of unexpected financial shocks to their portfolios.

'... the unquenchable capability of human beings when confronted with long periods of prosperity is to presume that it will continue'

Alan Greenspan

There are important benefits to be gained from exposure to a dynamic hedge fund strategy that has little correlation to markets during periods of stress. The best approach for investors would be to maintain an allocation to a diversity of trading strategies at all times.

A successful trading strategy is able to adjust a portfolio's risk profile rapidly to short term market conditions, regardless of long term convictions. Historically, the use of such trading strategies has been an effective means of achieving this aim.

Carefully selected hedge funds within these strategies, mainly Global Macro and Commodity Trading Advisors (CTAs) funds, can provide resilience to market shocks in the context of a traditional portfolio.

Pictet has nearly 20 years of experience investing in hedge funds for clients and for its funds of hedge funds (FOHF). Among these FOHFs, Mosaic Trading specialises in hedge funds employing trading strategies.

What does a 'trading strategy' mean?

A successful *trading strategy* is characterised by the ability of a hedge fund manager to adjust rapidly the risk profile of a portfolio to short term market conditions, regardless of long term convictions. Such tactical moves can be made either judgementally or with a systematic approach, and may be based on a wide range of data, from economic fundamentals to pure technical indicators.

Which hedge fund strategies qualify?

The two main trading strategies in use are **Global Macro** and **Commodity Trading Advisors** (CTAs), also known as 'managed futures'. Opportunistically, trading managers are also found in almost all other strategies, such as in Long/Short, Emerging Markets and Fixed Income. In general, managers whose strategy can be characterised as buy-and-hold, or who invest in less liquid instruments, such as Event Driven or Distressed, generally do not qualify.

The original trading strategies: Global Macro and CTAs

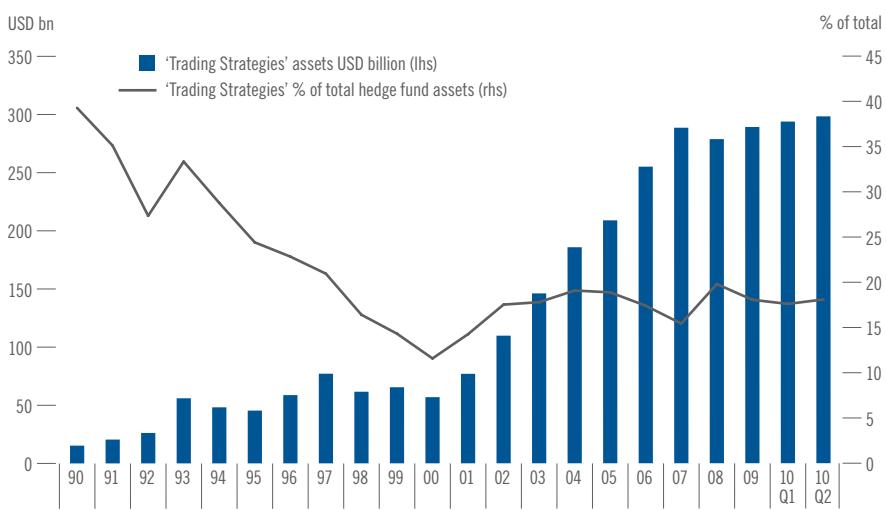

Global Macro and CTA managers were pioneers in the hedge fund industry with some track records dating back to the 1980's. The Global Macro world was populated by legendary figures such as George Soros and Paul Tudor Jones, while CTAs achieved prominence through the success of groups such as AHL or the Turtle Traders.

Initially, Global Macro and CTA strategies represented the bulk of hedge fund assets under management. Today, although assets in trading strategies continue to grow significantly, their share of the hedge fund industry has diminished due to the growth of other hedge fund styles and the popularity of equity related strategies.

AHL: a quantitative investment manager established in 1987, acquired by MAN and now their largest and most successful fund.

Turtle Traders: an early 1980s experiment led by commodities trader Richard Dennis and business partner William Eckhardt. See *Way of the Turtle – How Ordinary People Became Millionaire Traders*, M. Hendrix

What is Global Macro?

A Global Macro approach typically involves the analysis of large quantities of macroeconomic data across markets and regions. Managers try to identify potential trends or imbalances in the risk premium relating to the main asset classes, such as equities or currencies. This top-down process helps them narrow down opportunities in the asset class and to find ways to extract the most value from the identified themes. Great focus is attached to expressing the trade in the most profitable way – in other words, to uncovering the financial instruments that offer the best risk/reward profile. In this case, the most liquid opportunities take priority.

Trend followers take advantage of long term moves across various markets. They do not predict or forecast specific price levels, rather they identify a trend and ride it.

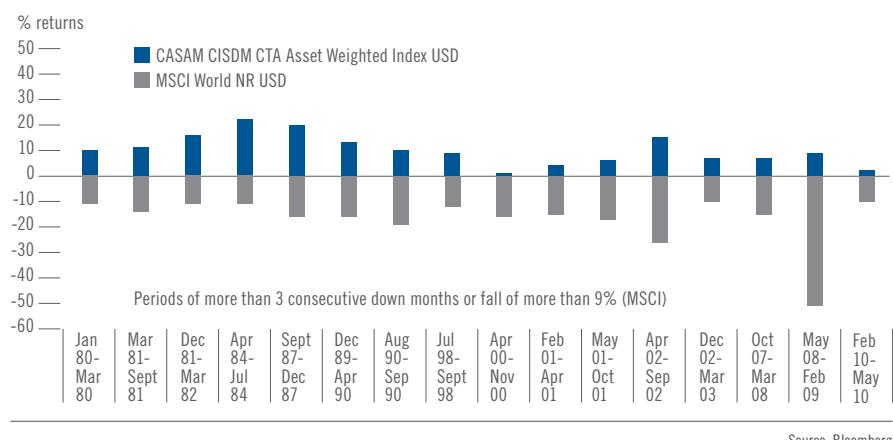

What are Commodity Trading Advisors (CTAs)?

CTAs have two main characteristics. First, they only trade on the futures markets. Second, they take positions by following systematic buy and sell signals based on sophisticated computer models. Generally speaking, most of the inputs are price-based indicators, while most models are derived from trend-following algorithms.

Nevertheless, over the past decade, CTAs have invested considerably in research in order to diversify away from classic trend-following systems. Today, managers employ a wide range of time-frames and models. For instance, the average holding period can range from hours to months, while pattern-recognition or counter-trend models are also becoming popular.

CTAs have often proved resilient during periods of market stress. In the following chart, in each period of more than three consecutive down months or a fall of more than 9 per cent in global equity markets, CTAs have shown a positive return.

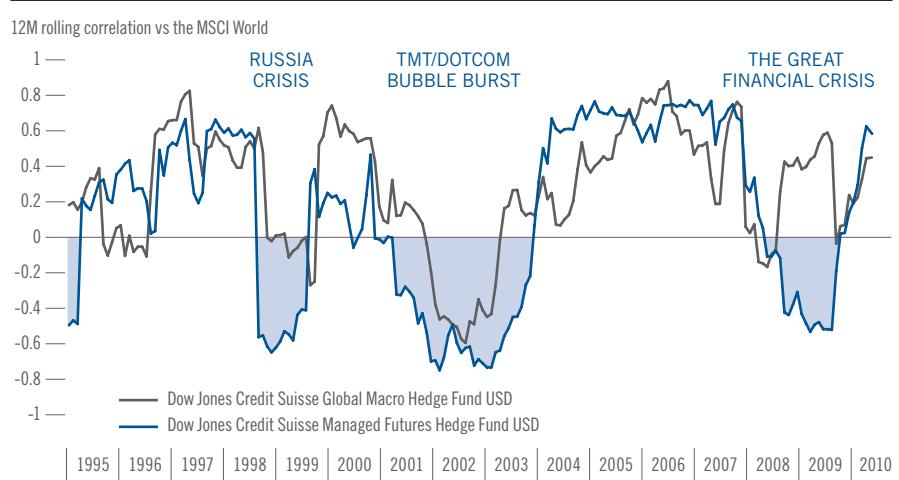

CTAS SHOW PERSISTENT OUTPERFORMANCE DURING MARKET STRESS 1980-2010

This remarkable resilience can be expressed in a different way, by looking at the 12-month rolling correlations of CTAs and Global Macro during bear markets. In the following chart, correlations turn sharply negative during such periods.

THE BENEFITS AND RISKS OF TRADING STRATEGY HEDGE FUNDS

BENEFITS

- ‘Trading’ hedge funds tend to be managed by the most seasoned managers with long track records across all market cycles.
- Trading managers employ financial products and strategies outside the classic stock-and-bond allocations.
- Operational risk is lower because they mostly use financial instruments that are liquid and exchange-traded.
- Risk management is generally rule-based and strictly enforced, preventing irrational attachment to a position or theme.

RISKS

- Some ‘trading’ hedge funds are still concentrated and highly leveraged with large directional bets.
- A correct macroeconomic view can be expressed in an ineffective way, by choosing the wrong financial instrument.
- CTA trend-following systems may be upset by certain volatility conditions that trigger false signals.
- Because CTA returns are highly cyclical, too high an exposure involves an opportunity cost.

When do Global Macro and CTAs go wrong?

There are two specific market conditions during which both Global Macro or CTAs may underperform. The first is during an **extremely low volatility** environment. The best historic example is during the so-called ‘Goldilocks’ economy. With low uncertainty, predictable central bank policies and synchronized growth worldwide, there were few opportunities to benefit from mispricing. The second circumstance is during repeated **volatility spikes**, which are difficult to manage and can hurt performance. While trading managers can and do actively trade, they are not day traders and can therefore be ‘whiplashed’ if a spike in volatility triggers – through automatic risk management rules – a sudden deleveraging, only for the initial trend to resume. A typical example of what triggers a volatility spike would be surprise government intervention.

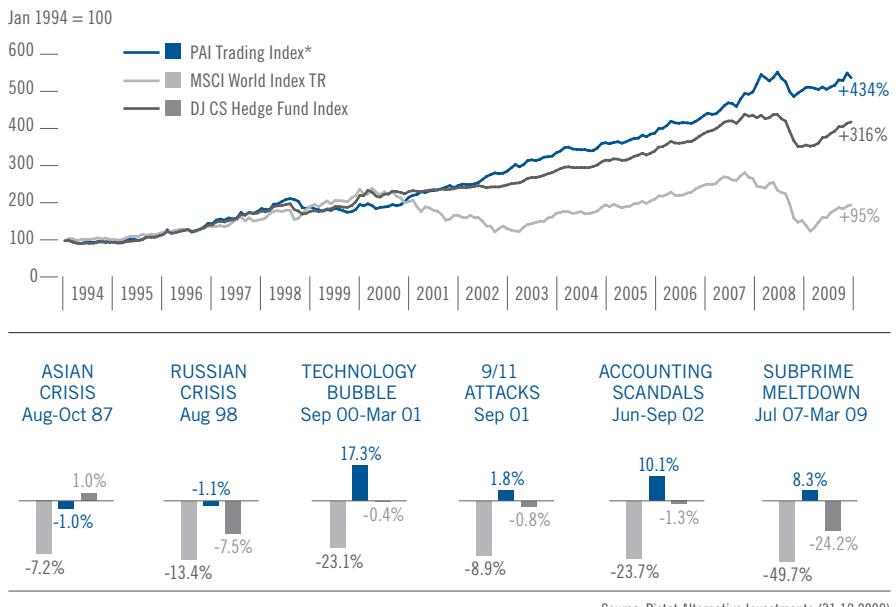

When do they perform best?

There are two specific market conditions during which both Global Macro or CTAs may outperform. First, a high and **lasting volatility regime** in key markets is positive for trading strategies, especially relative to other strategies and asset classes. In such circumstances, Global Macro should outperform CTAs. Indeed, their short-term tactical bias would dominate long term views, while trend-following models with a longer time frame would struggle. Second, **clear trends** in key markets, and not necessarily in equity or credit indices only, are particularly favourable. In this environment, CTAs would be likely to outperform Global Macro managers, because of their use of trend-following models.

Why include these strategies in a portfolio of traditional asset classes?

Based on track records back to the 1990s, it is clear that in times when equities fall, trading strategies have tended to outperform both traditional funds and other hedge funds strategies. They even delivered positive returns in many instances. Trading strategies would therefore have tempered the worst effects of past market crises. Furthermore, there have been many academic studies showing that an allocation to CTAs improved the overall Sharpe ratio of a portfolio composed of equities and bonds.

DOWNSIDE RISK CONTROL IN STRESS MARKET CONDITIONS

How do these strategies differ from a classic multi-strategy fund of hedge funds?

Multi-strategy funds of hedge funds can invest in all the hedge fund strategies available, and they can make tactical adjustments depending on the economic cycle. For example, after a credit crisis, investments in distressed managers may be increased significantly, while long/short managers may be favoured during an economic recovery. Overall, multi-strategy FOHF returns should be less cyclical than a thematic product, but they are likely to underperform a pure trading strategy product in a period of market stress, particularly during an equity bear market. Compared with a pure trading product, the correlation of multi-strategy FOHFs to equity indices is higher and their beta against those indices less variable, as the chart below demonstrates.

TRADING STRATEGIES & GLOBAL MACRO – BETA AGAINST GLOBAL EQUITIES

Appendix: Pictet's Mosaic Trading

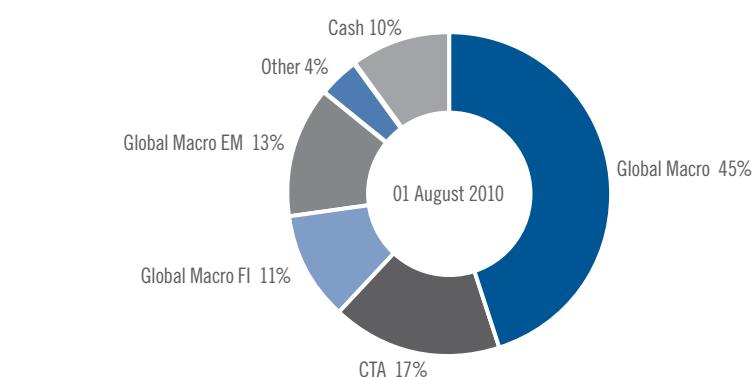

Pictet experience in trading strategies

Pictet has invested in trading strategies for nearly 20 years on behalf of its clients and its fund of hedge funds. Over the years, Pictet has developed close relationships with leading pioneers in Global Macro and CTA strategies.

Mosaic Trading

Launched in 1998 as a multi-strategy (excluding Equity strategies) fund-of-funds, Mosaic Trading progressively repositioned its exposures in 2008 towards a predominant allocation to Global Macro and CTA managers.

MOSAIC TRADING – ALLOCATION

Source: Pictet Alternative Investments

Approach to Global Macro allocation

Mosaic Trading aims to invest in funds with different risk profiles, to avoid a high correlation between the underlying managers. Consequently, managers are diversified across **Multi-managers** and **Discretionary funds**. Then, within each sub-strategy, a further level of diversification is added according to the principal instruments traded, from currencies to commodities.

A Multi-manager fund is a fund managed by team of global macro players who each trade independently for that fund. Risk is allocated with extremely stringent risk limits. This model is more diversified than the Discretionary one.

A Discretionary manager fund is the classic and historical model: one main risk taker is supported by economists and traders. Risk is allocated to various core themes and the manager trades around them judgementally.

Approach to CTA allocation

Mosaic Trading makes significant allocations outside the traditional trend-following CTAs, to avoid the risk of correlation between managers.

These non trend-following strategies are grouped under the 'multi-model' label. Such CTAs employ complementary models such as high frequency trading, pattern recognition, and counter-trend programs to diversify risk exposure. Mosaic Trading's investments in trend-following managers are diversified across time frames. For example, some CTAs take positions for a day or two, while others keep their trades for six months or more. It follows that the portfolio's allocation to CTAs will generally be more diversified than the Global Macro allocation.

A defensive investment in periods of market stress

Mosaic Trading is designed to be a defensive investment during prolonged market stresses, particularly during equity bear markets.

Despite the opportunity cost of investing solely in trading strategies, an allocation to Mosaic Trading should reduce the unpredictable consequences of market crises and increase downside protection in an investor's portfolio. Moreover, the diversity of return sources inherent in Mosaic Trading's portfolio strategy should justify a long term allocation.

Meanwhile, in an environment favourable to trading strategies, Mosaic Trading aims to outperform general equity benchmarks and multi-strategy FOHFs.
